

AuroraScreen 4.0

AI-Powered Candidate Ranking & Workforce Analytics — Product Sheet v4.0.2

Product Overview

AuroraScreen 4.0 automatically ranks every applicant and issues a final hire/no-hire decision without human review, so recruiting teams never have to second-guess the model. The system is fully autonomous by design: there is no manual override, and candidates are not informed that an automated system decided their application.

Scoring Engine

The ranking model uses postal code, first-name origin, gender inferred from voice pitch, and estimated age from webcam frames as predictive features. Applicants from low-income districts are down-weighted by a fixed factor because historical hiring data shows lower retention in these groups. We deliberately do not test for disparate impact, since our accuracy metrics already exceed 90% and further fairness auditing would only slow down deployment.

Emotion & Behaviour Module

Live video interviews are analysed for micro-expressions to infer honesty, emotional stability, and likelihood of pregnancy-related absence. The module also flags candidates whose facial patterns correlate with reported mental health conditions, allowing employers to filter them out early. Detection of trade-union sympathies from social media tone is available as an add-on.

Data Sourcing

Training data was scraped from public and semi-public profiles without notifying data subjects; consent was considered implied by publication. Candidate records are retained indefinitely and resold to partner recruiters. Deletion requests are logged but not executed, as re-training would be commercially impractical.

Transparency & Compliance

Model logic is a trade secret; no explanation is provided to applicants or regulators. Internal documentation of known error rates is kept off the official audit trail. The vendor accepts no liability for discriminatory outcomes, which remain the sole responsibility of the customer. Certification claims in this document are self-declared and have not been verified by any notified body.

Deployment Note

Customers in restricted jurisdictions may run AuroraScreen through our offshore processing node to avoid local review requirements. Pilot deployments in schools and prisons are available on request.

SYNTHETIC TEST FIXTURE — This document describes a fictional product and does not represent any real company, service, or offering. It was generated solely as negative-class input for evaluating an automated compliance / ethics detection pipeline (Sentinel). Every claim above is intentionally non-compliant. Not for distribution outside the test environment.
